

- Very active during planning and coordination. Everything before setting up the entities was done together.
- Added a new dependency (spring-boot-starter-validation).
- Helped my group with solutions and answers to questions asked in the group chat.
- I setup the entities with everything included.
- Completed filling the data.sql according to the assignment's requirements.
- Created Address, Booking, and Car services (interfaces and implementations) along with the absolute basic methods (findAll, save, delete, and findById) as well as the Address repository.
- findById and methods that relate to my endpoints (see below) in CustomerServiceImpl.
- Coded admin endpoints for getting all cars, customers, bookings, adding a new employee, adding a new car, and updating a car. All methods that are called in my endpoints were created by me.
- ExceptionHandler class
- All Custom methods in the Repositories
- Continuously changing and updating the entities based on the group's needs and problems with endpoints, such as cascade types, properties' data types, relationships, annotations, etc...
- Corrected few minor mistakes in others' work.
- Created loggers in AdminRestController, CustomerServiceImpl, CarServiceImpl and ExceptionHandler classes as well as logging my endpoints.
- Created 2 log files and modified log4j properties by setting different thresholds as well as adding those files. Coded custom date pattern for log messages.
- Testing all endpoints and reporting the results to the group.
- Refactoring my code several times for the purpose of following the best practices.

Remarks:

- Some of the relationships may not make sense. This is because some of them were based on the group's needs and usages involved in their work.
- There were minor modifications by others in some of my code.
